

# Employee data import journey

Customer journey map — Import Data using Transform Maps (Spreadsheet)

|                      | Prepare / Spreadsheet                                                          | Create Target / Table                                                                                     | Load Data / / Import Set                                                     | Create & Map / Transform                                                                                           | Transform & / Validate                                                   | Prevent / Duplicates                                                                                        | Reports & / Dashboard                                                                 |
|----------------------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Steps                | Open/create employee spreadsheet; ensure headers and sample records are ready. | Create Employee Test custom table and configure Employee ID, Name, Email, Department and Location fields. | Use Load Data to create/use Employee Import as the staging Import Set table. | Create Sample Spreadsheet Import Transform Map; select source/target and map fields using Auto Map/Mapping Assist. | Run Transform and verify records in Employee Test and Transform History. | Enable Coalesce on Employee ID so repeated imports update existing records instead of inserting duplicates. | Create department/location/list reports and add them to Employee Analytics Dashboard. |
| Interactions         | Spreadsheet / Google Sheets                                                    | ServiceNow table form                                                                                     | Load Data / Import Set                                                       | Transform Map / Mapping Assist                                                                                     | Transform History / Employee Test                                        | Coalesce field / repeated import                                                                            | Reports / Dashboard                                                                   |
| Goals & motivations  | Prepare clean source data.                                                     | Create the required employee fields.                                                                      | Stage data safely before transformation.                                     | Map source data to the right target fields.                                                                        | Confirm imported records are correct.                                    | Keep employee data free from duplicates.                                                                    | Monitor employee data and import results.                                             |
| Positive moments     | Clear spreadsheet structure                                                    | Fields are explicitly configured                                                                          | Import Set provides staging                                                  | Auto Map speeds mapping                                                                                            | Successful transform confirms records                                    | Coalesce keeps repeated imports clean                                                                       | Reports give visual visibility                                                        |
| Negative moments     | Missing or inconsistent source fields                                          | Manual table/field setup                                                                                  | Incorrect import configuration                                               | Mapping mistakes                                                                                                   | Need to inspect transform results                                        | Duplicate-record risk without Coalesce                                                                      | Manual analysis without reports                                                       |
| Areas of opportunity | Standardize spreadsheet templates                                              | Prefine required fields                                                                                   | Validate source data before loading                                          | Use consistent mapping rules                                                                                       | Use Transform History for verification                                   | Coalesce on a unique employee identifier                                                                    | Automate dashboards and reporting                                                     |

SCENARIO: Import, transform, validate and monitor employee spreadsheet data in ServiceNow
